

modularity in syntax a pdf

Broadly speaking, modularity is the degree to which a system's components may be separated and recombined, often with the benefit of flexibility and variety in use. The concept of modularity is used primarily to reduce complexity by breaking a system into varying degrees of interdependence and independence across and "hide the complexity of each part behind an abstraction and interface."

The syntax of textual programming languages is usually defined using a combination of regular expressions (for lexical structure) and Backusâ€Naur form (for grammatical structure) to inductively specify syntactic categories (nonterminals) and terminal symbols. Syntactic categories are defined by rules called productions, which specify the values that belong to a particular syntactic category.

The syntax-rule macro system of R5RS does not seem to scale beyond simple macros. It is very difficult to write macros that compose, to assemble complex macros from already written and tested components. The previous approaches to composable syntax-rules are heavy, notationally and computationally ...
